No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel albumin fusion protein comprising a Kunitz domain peptide or its fragment or variant and an albumin or its fragment or variant. The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The current sequence is that of the albumin fusion protein-related C-terminal BamHI-HindIII DX-890 cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a C-terminal gamHI-HindIII DX-890 cDNA. This sequence is used in the exemplification

The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The current sequence is that of the albumin fusion protein-related N-terminal BgIII-

The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleedding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a N-terminal EgIII-BamHI DX-890 cDNA. This sequence is used in the exemplification of

The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The current sequence is that of the DX-890 DNA of the invention which was inserted aspEPI/KpnI site of plasmid pDB2300X2 modified NotI expression cassette.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mating factor prepropeptide or its variant, which is modified so as to creplace the lysine residue in position 76 of the amino acid sequence of the naturally occurring prepropeptide by an Alanine residue. The cullectide sequence is ligated to the 5' terminal of a nucleotide sequence is ligated to the 5' terminal of a nucleotide sequence coding for EPI-NNE-4. An expression vector for the sequence is also claimed. The gene construct or vector is useful for transforming microorganisms (particularly yeast) to produce EPI-NNE-4 protein with cullectide sequence, expression vector or microorganism is useful for uncleotide sequence, expression vector or microorganism is useful for producing or secreting a protein, particularly EPI-NNE-4, which contains undetectable levels of the EPI-NNE-4 (n+9). This facilitates further purification steps, and therefore results in economies both on the financial and time-spent scale. The present sequence is a fusion sequence containing the S. cerevisiae alpha mating factor prepropeptide coding sequence and the Pichia pastoris EPI-NNE-4 coding sequence and used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Local Similarity:

Genetically engineered human derived Kunitz domains can be used to cinhibit human neutrophil elastase, an enzyme involved in the elimination of chibit human neutrophil elastase, an enzyme involved in the elimination confidence of pathogens and the restructuring of connective tissue. In cases of contity of the circulating alpha-1-protease inhibitor (ApI or alphal cantitypsin), or the inactivation of ApI by oxidation (smokers contitypsin), or the inactivation of the lung tissue may result from the controlled elastolytic activity of human neutrophil elastase. Other crespiratory disorders such as cystic fibrosis are thought to be caused by the controlled elastolytic activity of human neutrophils. The genetically condineered human derived Kunitz domains can be used to treat such crespiratory disorders. See AAR99146-R99211. Fusion genes were used in the production of the Kunitz domain derivatives. Protein expression cassettes care then cloned into the plasmid pHIL-D2 using BatBI and EcoRI control of Pichia pastoris aox1 gene promoter and regulatory sequences cand downstream polyadenylation and transcription termination sequences. The proteins derived from the BPTI and ITI-D2 Kunitz domains. This sequence is a BstBI-AatII-EcoRI expressio cassette for expression of EPI-ture.

                                                                                                                                                                                                                                                                                                                                 Alignment
                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a fused gene construct, which comprises CC a nucleotide sequence coding for the Saccharomyces cerevisiae alpha can mating factor prepropeptide or its variant, which is modified so as to CC replace the Lysine residue in position 76 of the amino acid sequence of CC the naturally occurring prepropeptide by an Alanine residue. The nucleotide sequence is ligated to the 5' terminal of a nucleotide sequence coding for EPI-NNE-4. An expression vector for the sequence is also claimed. The gene construct or vector is useful for transforming conicroorganisms (particularly yeast) to produce EPI-NNE-4 protein with CC very low levels of its improperly processed form. The gene construct or vector or microorganism is useful for producing or secreting a protein, particularly EPI-NNE-4 which contains conducing or secreting a protein, particularly EPI-NNE-4, which contains conducted the sequence, expression vector or microorganism is useful for producing or secreting a protein, particularly EPI-NNE-4, which contains contacted the sequence is and therefore results in economies both on the particularly EPI-NNE-4, which contains contacted the present sequence is a mutated version of the Etchia pastoris EPI-NNE-4 coding sequence used in the examplification of the invention
                                                                                                                                                                                                                                                                                                                                                                 Sequence 445 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                microorganisms

The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The curre sequence is that of the C-terminal albumin-(GGS)4GG-DX-890 fusion DNA or the control of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 11
                                                                      The invention relates to a novel albumin fusion protein comprising a Kunitz domain peptide or its fragment or variant and an albumin or its fragment or variant. The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The curre sequence is that of the N-terminal DX-890-(GGS)4GG-albumin fusion DNA cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (AVET )

The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a C-terminal DX -890-(GGS)4 GG-albumin fusion DNA. This fusion DNA contains DX-890 cDNA, GS linker region and human albumin (HA). This sequence is used in the exemplification of the invention.

The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a N-terminal DX 890-(GGS)4 GG-albumin fusion DNA. This fusion DNA contains DX-890 cDNA, GS linker region and human albumin (HA). This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                    albumin fusion; Kunitz

The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The current sequence is that of the albumin fusion protein-related plasmid pDB2300X2 modified NotI expression cassette DNA of the invention which has N-terminal DX-890 and C-terminal linker ready for a second DX-890 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hauser H,

                                                                                                                                               US-10-038-722-27 (1-56) x ADR90045
                                                                                                                                                                The invention relates to proteins comprising kunitz domain peptide, designated DPI-14 for inhibiting human neutrophil elastase, fused to albumin. The invention is useful for treating cytic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a DDE3300X2-2xGS linker fusion DWA. This chimeric DNA contains DX-890 cDNA at its N-terminal end, rHA synthase gene and the linkers at its C-terminal end. This sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            designated DPI-14 for inhibiting human neutrophil elastase, fused to albumin. The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a pDB2300X3-2xDX-890 fusion DNA. This chimeric DNA contains two DX-890 cDNAs, rHA synthase gene and the linkers. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                            Synthetic.

The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing a composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The current sequence is that of the albumin fusion protein-related plasmid pDB2300X3 modified NotI expression cassette DNA of the invention which has 2 DX-890
                                                                                                                                                                                                                                         albumin fusion; Kunitz domain; cytostatic; haemostatic; hereditary angioedema; cancer; bleeding; gene therapy; ds; DPI-14-(GGS)4GG-THA-(GGS)4GG-DX-890 fusion; gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel albumin fusion protein comprising a Kunitz domain peptide or its fragment or variant and an albumin or its fragment or variant. The fusion protein of the invention demonstrates cytostatic and haemostatic activities and may be useful for preparing composition for treating a patient with hereditary angioedema, an angioedema-related disease, cancer, a cancer-related disease or a bleeding disorder, as well as during gene therapy procedures. The curr sequence is that of the plasmid pDB2301X-derived DPI-14-(GGS)4GG-THA-(GGS)4GG-DX-890 fusion DNA of the invention. NOTE: This sequence also contains regions of cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (AVET )

                                                                                 Pred. No.:
                                                                                                                                        The invention relates to proteins comprising kunitz domain peptide, designated DPI-14 for inhibiting human neutrophil elastase, fused to albumin. The invention is useful for treating cystic fibrosis and related diseases, hereditary angioedema, cancer and related diseases including chronic obstructive pulmonary disease, asthma, bronchitis, acute respiratory syndrome, pneumonia and bleeding. The invention acts as a cytostatic and haemostatic agent. The present sequence is a DPI-14-(GGS)4 GG-DX-890 fusion DNA. This fusion DNA contains DPI-14 CDNA, GS linker region, THA (human albumin) synthase gene and DX-890 cDNA. This sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ś
             Genetically engineered human derived Kunitz domains can be used to coinhibit human neutrophil elastase, an enzyme involved in the elimination of of pathogens and the restructuring of connective tissue. In cases of creduction of the circulating alpha-1-protease inhibitor (API or alphai cantitrypsin), or the inactivation of API by oxidation (smokers connective), extensive destruction of the lung tissue may result from controlled elastolytic activity of human neutrophil elastase. Other crespiratory disorders such as cystic fibrosis are thought to be caused by human neutrophil elastase or elease by neutrophils. The genetically controlled fundant derived kunitz domains can be used to treat such crespiratory disorders. See AAR99146-R99211. Fusion genes were used in the production of the Kunitz domain derivatives. Protein expression cassettes are then cloned into the plasmid pHIL-D2 using BstB1 and EcoRI crestriction sites. The cloned sequence is under the transcriptional control of Pichia pastoris aox1 gene promoter and regulatory sequences and downstream polyadenylation and transcription termination sequences. Transformed strains of P. pastoris were used to express the various EPI-creations of the protein sequences are the protein sequences.
                                                                                                                                                                                                                                                                                                                                                                New engineered inhibitors of human -like Kunitz domain for treating, e respiratory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Aprotinin; Kunitz domain; human neutrophil elastase; hNE; connective tissue; alpha 1 protease inhibitor; API; neutro alphal antitrypsin; respiratory disorder; cystic fibrosis;

control of Pichia pastoris aoxi gene promoter and regulatory sequences and downstream polyadenylation and transcription termination sequences. Transformed strains of P. pastoris were used to express the various EPI-HNE proteins derived from the BPII and ITI-D2 Kunitz domains. This sequence comprises pHIL-D2 having an EPI-HNE-3 Kunitz domain expression cassette inserted into it. It was designated pD2pick (MFalphaPrePro::EPI-HNE-3). This sequence differs from the sequence given in AAT35166 by having had two restriction sites, one BstBI and one AatII site, removed from the sequence. This means that the Kunitz domain encoding segment is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                reduction of the circulating alpha-1-protease inhibitor (API or alphal antitrypsin), or the inactivation of API by oxidation (smokers emphysema), extensive destruction of the lung tissue may result from uncontrolled elastolytic activity of human neutrophil elastase. Other respiratory disorders such as cystic fibrosis are thought to be caused by human neutrophil elastase release by neutrophils. The genetically engineered human derived Kunitz domains can be used to treat such respiratory disorders. See ARR99146.R99211. Puston genes were used in the respiratory of the content of the cont

The present invention describes drug compositions which contain as an active component a peptide which has specific affinity to particular CC phospholipids (such as phosphatidyl ethanolamine or phosphatidyl serine), ce especially to phospholipids which constitute a lipid bilayer of cellular CC cortex and of which the concentration in the bilayer increases in cells which are abnormal (e.g. through injury, denaturation or activation). In CC particular, the peptide contains a sequence having phospholipid affinity CC and a structure of formula (I): (A1)a-(A2)b-(A3)c, where (A1) is one of CC two specific sequences (see AAW69516), (A2) and (A3) are CC TRYLRIHPOSWYHQIALR, LRYLRIHPOSWYHQIALR (see AAW69517) or MEDUGCEAQNLY (see AAW69518); a = 0-5; b = 1-5, and c = 0-5. Preferred are the formulae CC A1-A2-A3, A2-A2-A3, A2-A3, A2-A2-A3, A2-A3, A2-A2-A3, A2-A3, A2-A2-A3, A2-A3, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drugs containing peptide(s) with specific affinity to phospholipid(s) such as phosphatidyl serine, for treatment of blood coagulation, inflammatory and immunological disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAQ78607 is a nucleotide sequence which is downstream of a nucleotide sequence that encodes E. coli alkaline phosphatase signal peptide. It encodes the protein shown in AAR65476. Plasmid pM594, used for the expression of AN68 (sic) (see AAR65478), was constructed from plasmid pM552 which contains a tryptophan promoter, a Kanamycin resistant gene and also AAQ78607. The vectors for the expression of AN68, each contain a nucleotide sequence of general formula: j-x-y-z (j = AAQ78606; x = AAQ78598/Q78601; y = a nucleotide sequence that encodes Met; and z represents the nucleotide sequence that encodes Met; and z interest is expressed as a fusion protein contg. 'X' (encoded by x), its expression and/or secretion quantity increases. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                     The sequences given in AAQ64756-59 are DNA sequences encoding extended versions of a wild type core polypeptide which acts as a protease inhibitor. The peptides encoded by these sequences may also contain deletions within the core region (see also AAQ64751-55). These deletions lead to the production of peptides with enhanced protease inhibitor action. These peptides may be used for the prevention and therapy of diseases related to protease, such as operation invasion, polyorgan failure, shock, pancreatitis, intravascular coagulation disease, dyspnea disease of adult, chronic articular rheumatism, arthritis or allergy. (Updated on 10-MAR-2003 to add missing OS field.)
